A Two-level Modular Design Hierarchy

The system comprises four "hidden" modules and a "System Integration and Testing" stage. From the standpoint of the designers of A B, C, and D (the hidden modules), system integration and testing is simply another module: they do not need to know the details of what goes on in that phase as long as they adhere to the global design rules. Obviously, the converse is not true: the integrators and testers have to know something about the hidden modules in order to do their work. How much they need to know depends on the completeness of the design rules. Over time, as knowledge accumulates, more testing will occur within the modules, and the amount of information passed to the integrators will decrease. The special, time-dependent role of integration and testing is noted by the heavy black border around and gray shading within the "module."

The Effect of Six Operators on a Modular System

We started with a generic two-level modular design structure, as shown in Figure 5-3, but with six modules (A, B, C, D, E, F) instead of four. (To display the porting operator, we moved the "System Integration & Testing Module" to the left-hand side of the figure.) We then applied each operator to a different set of modules.

Module A was Split into three sub-modules. Three different were developed for Module B. Substitutes Module C was Excluded. A new Module G was created to Augment the system. Common elements of Modules D and E were Inverted. Subsystem design rules and an architectural module were developed to allow the inversion. Module F was Ported. First it was split; then its "interior" modules were grouped within a shell; then translator modules were developed.

The ending system is a three-level system, with two **modular subsystems** performing the functions of Modules A, D and E in the old system. In addition to the standard hidden modules, there are three kinds of special modules, which are indicated by heavy black borders and shaded interiors:

System Integration & Testing Module Architectural Module Translator Module(s)
