

Change in the Distribution of Sale/Rental Prices: Comparison of Beijing and Tokyo

Yongheng Deng, NUS

Xiangyu Guo, NUS

Chihiro Shimizu, NihonU

HIT-RIETI Workshop, Tokyo, Dec 14 2017

Cross-country comparison

Introduction

Methods

Data

Results

Conclusion

2

- Knoll et al. (2017) No price like home *AER*
 - 17 advanced countries' annual house prices indices
 - Rose strongly and with substantial cross-country variation after 1950s
- Gyourko et al. (2006) Superstar Cities *AJ*
 - “Superstar”: inelasticity of housing supply and growth in aggregate demand
 - High house prices and price-to-rent ratios crowd out lower-income households
- Only mean or median based Indices used

Japanese Housing market

Introduction

Methods

Data

Results

Conclusion

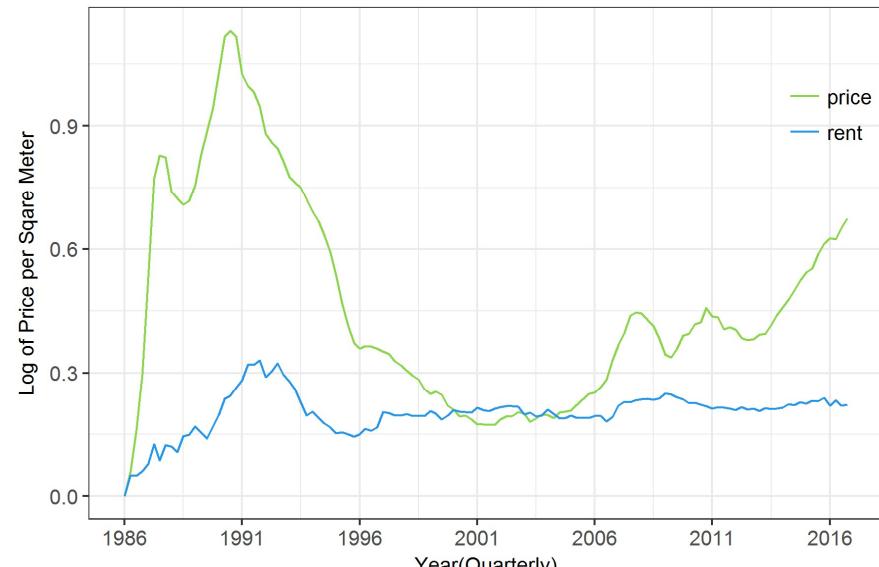

3

Housing market cycle in Japan

- Boom in late 1980s
- Recovery after 2000

Sale and Rental market

- Prices have larger variation
- Rents stable after 1997
- Quality differ across market
- Spatial variance

Price Index of Tokyo

Chinese Housing Market

Introduction

Methods

Data

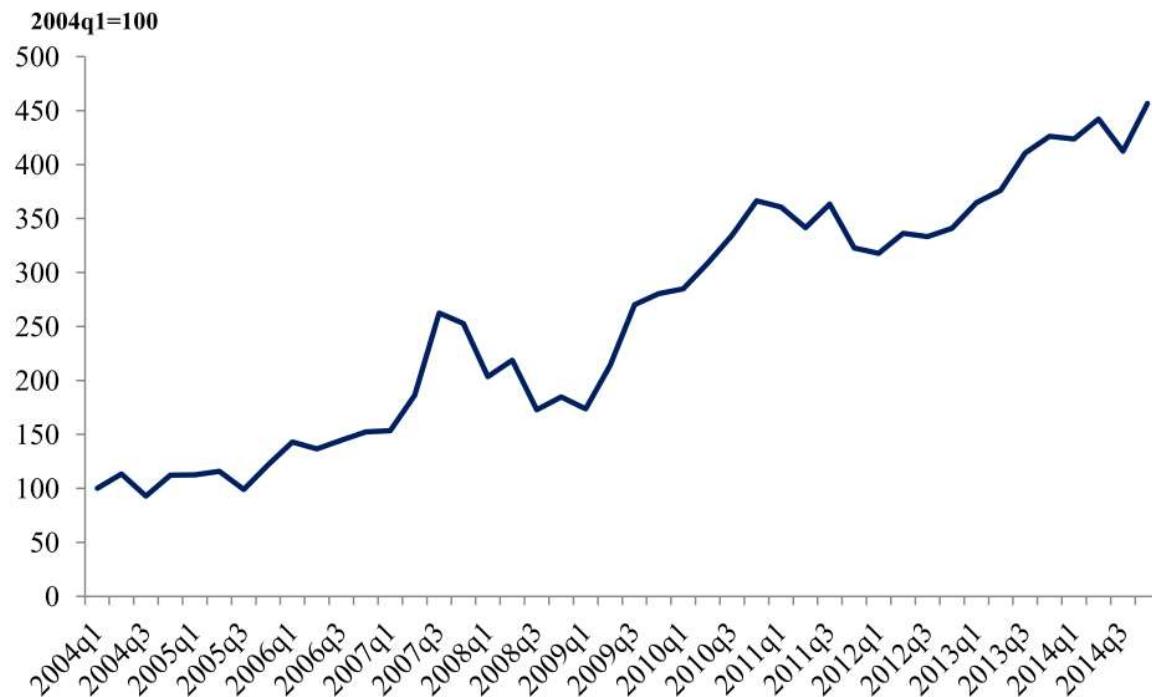

Results

Conclusion

4

- Start late as land reform after 1988
- Keep Booming for last 20 years
- Beijing is the most typical “superstar” city in China

**Figure 2: Chinese National Real Residential Land Price Index, 35 Markets,
Constant Quality Series (Quarterly: 2004q1 – 2014q4)**

Price-to-rent Ratio

Introduction

Methods

Data

Results

Conclusion

5

- Stiglitz (1990): “If the reason that the price is high today is only because investors believe that the selling price will be high tomorrow—when ‘fundamental’ factors do not seem to justify such a price—then a bubble exists.”
- In a branch of the literature, house sale and rental prices lie at the heart of examining house price bubbles and disorders in the housing markets
 - e.g., McCarthy and Peach, 2004; Himmelberg et al., 2005; Campbell and Shiller, 1988, 2005; Brunnermeier and Julliard, 2008; Campbell et al., 2009; Wu et al., 2012; and Ambrose et al, 2015.

User Cost Framework

Introduction

Methods

Data

Results

Conclusion

6

- Porterba (1984) and Himmelberg et al. (2005)
- $u_t = r_t^{rf} + \omega_t + \delta_t + \gamma_t - g_{t+1}$ ($R_t = u_t P_t$)
 - r_t^{rf} is risk-free interest rate,
 - ω_t denotes transaction costs and property taxes,
 - δ_t reflects maintenance costs and depreciation rate,
 - γ_t is the risk premium associated with housing,
 - g_{t+1} is the expected capital gain.

Estimate Price-to-rent ratio

Introduction

Methods

Data

Results

Conclusion

7

● Previous Studies

- Compare Price Indices with rental indices (Fu and Ng, 2001; Gallin, 2008; and Campbell et al., 2009)
- Matching approach (Smith and Smith, 2006; Waltl, forthcoming)
- “Repeat-sales” style price-to-rent ratio (Bracke, 2015)

● This Paper

- Locally weighted regression
- Conditional Quantile Decomposition

Decomposition

Introduction

Methods

Data

Results

Conclusion

8

● Mean decomposition

- Oaxaca (1973) and Blinder (1973)
- $\hat{y}_1 - \hat{y}_2 = X'_1 \hat{\beta}_1 - X'_2 \hat{\beta}_2 = \underbrace{(X_1 - X_2)}_{\text{Variable}} \hat{\beta}_1 + \underbrace{\bar{X}_2 (\hat{\beta}_2 - \hat{\beta}_1)}_{\text{Coefficient}}$

● Distributional decomposition

- Conditional quantile regression (Machado and Mata, 2005)
- Distributional regression (Chernozhukov et al. 2013)
- Unconditional quantile regression, i.e. RIF-regression (Firpo et al., 2007 2009)

Decomposition

Introduction

Methods

Data

Results

Conclusion

9

- Spatial Extension of Machado and Mata (2005):

- (Total) $\hat{y}_1^m(\tau, \mathbf{z}_1) - \hat{y}_2^m(\tau, \mathbf{z}_2) = X_1^{m'} \hat{\beta}_1^m(\tau, \mathbf{z}_1) - X_2^{m'} \hat{\beta}_2^m(\tau, \mathbf{z}_2) =$

- (Variables) $X_1^{m'} \hat{\beta}_1^m(\tau, \mathbf{z}_1) - X_2^{m'} \hat{\beta}_1^m(\tau, \mathbf{z}_1) +$

- (Locations) $X_2^{m'} \hat{\beta}_1^m(\tau, \mathbf{z}_1) - X_2^{m'} \hat{\beta}_1^m(\tau, \mathbf{z}_2) +$

- (Coefficients) $X_2^{m'} \hat{\beta}_1^m(\tau, \mathbf{z}_2) - X_2^{m'} \hat{\beta}_2^m(\tau, \mathbf{z}_2)$

Sale and Rental Model

Introduction

Methods

Data

Results

Conclusion

10

Locally Weighted Approach

- Estimate same locally quantile regression for sale and rental datasets
- $\widehat{y}_p = X_p' \widehat{\beta}_p(\tau, z_p)$ and $\widehat{y}_r = X_r' \widehat{\beta}_r(\tau, z_r)$,
- $\tau = 0.02, .04, \dots, .98$, in increments of 0.02, number of quantiles $B = 48$

Decomposition

- (Total) $\widehat{y}_p - \widehat{y}_r = X_p' \widehat{\beta}_p(\tau, z_p) - X_r' \widehat{\beta}_r(\tau, z_r) = (\text{Variables}) + (\text{Locations}) +$
- (Coefficients) $X_p^{n_p'} \widehat{\beta}_p^{n_p}(\tau, z_p) - X_p^{n_p'} \widehat{\beta}_r^{n_p}(\tau, z_p)$

Method to calculate price-to-rent ratio

Introduction

Methods

Data

Results

Conclusion

11

Step 1. Estimate **locally weighted quantile regressions** in the set of target points of sale and rental datasets separately, $x(z)$, for each quantile range of $\tau = 0.02, 0.04, \dots, 0.98$, in increments of **0.02**, implies a number of quantile $B = 48$: $\arg \min_{\beta \in \mathbb{R}} \sum_i w_i(z) \rho_\tau(y_i - (x_i - x)' \beta)$. The estimate of target point in each τ -th quantile is $\hat{\beta}(\tau, z)$.

Step 2. Interpolate the quantile regression estimates $\hat{\beta}(\tau, z)$ of the set of target points to the full set of points represented in the data set. Then, I get n_p coefficient estimates $\hat{\beta}_p(\tau, z_p)$ and n_r coefficient estimates $\hat{\beta}_r(\tau, z_r)$ for each value of τ , one for each observation in sale sample and rental sample, where n_p and n_r are the numbers of observations in sale and rental datasets.

Step 3. Interpolate the coefficients in τ th quantile of **rental models**, $n_r \times k$ matrix $\hat{\beta}_r(\tau, z_r)$, to the location of **sales sample**, $n_p \times 1$ vector z_p , and get the $n_p \times k$ **counterfactual coefficients** matrix: $\hat{\beta}_r^C(\tau, z_p)$.

Step 4. Calculate the **spatial price-to-rent ratios** in τ th quantile for each observation in sale dataset $x_p(z_p)$: $ptr(\tau, z_p) = \exp(X_p \hat{\beta}_p(\tau, z_p) - X_p \hat{\beta}_r^C(\tau, z_p))$. The **kernel density** of $ptr(z_p)$ for each observation in sale dataset is estimated and **median** of $ptr(z_p)$ represent the spatial price-to-rent ratio.

Unconditional Quantile Regression

Introduction

Methods

Data

Results

Conclusion

12

- Firpo, Fortin, and Lemieux (2009) *Econometrica*

- RIF (recentered influence function) regression
- investigate the effect of changes in the explanatory variables on the marginal distribution of the dependent variable, instead of holding all other variables at their actual value.

- RIF Function

- $\widehat{RIF}(Y, \widehat{q}_\tau) = \widehat{q}_\tau + \frac{\tau - 1(y \leq \widehat{q}_t)}{f_Y(q_\tau)}$,
- $\widehat{q}_\tau = \arg \min_q \sum_{i=1}^N (\tau - 1(Y_i \leq q)) \cdot (Y_i - q)$
- $\widehat{f}_Y(y) = \frac{1}{N \cdot b_Y} \cdot \sum_{i=1}^N K_Y(\frac{Y_i - y}{b_Y})$, Gaussian kernel with bandwidth (Firpo et al., 2009)

Unconditional Quantile Decomposition

Introduction

Methods

Data

Results

Conclusion

13

● Unconditional quantile decomposition

- $\hat{\gamma}_{g,\tau} = (\sum_{i \in G} X_i \cdot X_i^T)^{-1} \cdot \sum_{i \in G} \widehat{RIF}(Y_{gi}, q_{g,\tau}) \cdot X_i, \quad g = 1, 0$
- $\hat{q}_1^\tau - \hat{q}_0^\tau = \underbrace{(\bar{X}_1 - \bar{X}_0)\hat{\gamma}_{0,\tau}}_{\text{Variable}} + \underbrace{\bar{X}_1(\hat{\gamma}_{1,\tau} - \hat{\gamma}_{0,\tau})}_{\text{Coefficient}}$

● Beijing and Tokyo data

- Price, Rent, and Price-to-rent ratio
- Beijing: 2005 and 2010
- Tokyo: 2005 and 2010 (1986 and 1991)

Change of Distribution in Housing market

Introduction

Methods

Data

Results

Conclusion

14

● Literature

- McMillen (2008) MM approach, Housing price in Chicago 1995-2005
- Nicodem and Raya (2012), Fesselmeyer et al. (2013), Thomschke (2015), Qin et al. (2016)

● Contribution

- Compare two housing markets
- Use sale price, rental price and estimated individually price-to-rent ratio

Data and model specification

Introduction

Methods

Data

Results

Conclusion

15

- Comparable micro-level Resale and Rental Data

- Tokyo 23 Special Wards
 - From 1986 to 2016
 - Provided by Recruit Co., Ltd.
- Beijing
 - From 2005 to 2010
 - Provided by 5i5j and Century 21

- Model specification

- $\ln P = \beta_0 + \beta_1 \ln(Size) + \beta_2 Age + \beta_3 d_{station} + \beta_4 d_{center} + D_{qtr}\gamma + D_{district}\delta + \varepsilon$

Conclusion

30

- Beijing experience larger appreciation between 2005 and 2010 than Tokyo.
The boom in Beijing 2005-2010 is similar with Tokyo 1989-1991.
- Appreciation of price-to-rent ratio is larger than price and rent during boom period in two economies.
