GVC Journeys

by Richard Baldwin & Toshihiro Okubo

RICHARD BALDWIN

PROFESSOR OF INTERNATIONAL ECONOMICS
THE GRADUATE INSTITUTE | GENEVA

Background question:

Was comparative advantage
denationalised?

#1. EMs
lowered
tariffs a lot

AEs much
less

#2. Shocking Share Shift in Manufacturing.

World shares:

- 7 'losers'
- 7 'risers'
- RoW = little change.

Source: unstats.un.org; 6 risers = Korea, India, Indonesia, Thailand, Turkey, Poland

#3.
Two-way
trade in
similar
goods goes
North-
South, too

Intraindustry trade indices

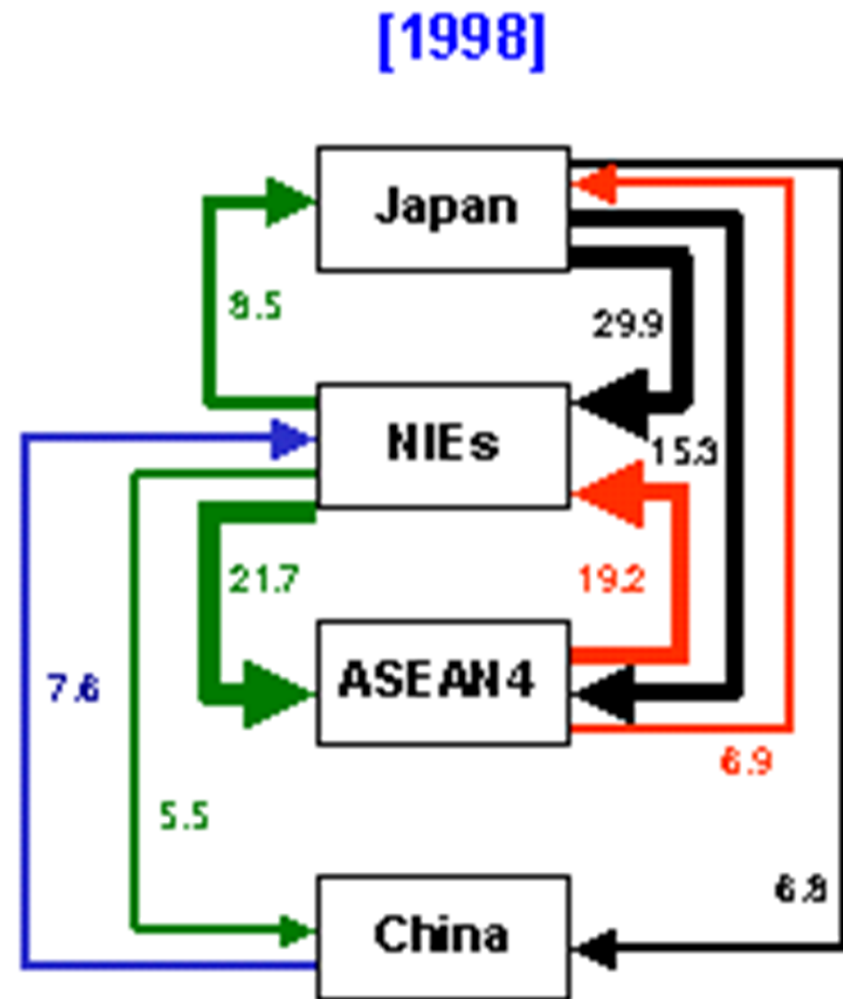

#4.
Two-way
trade in
similar
goods goes
North-
South, too

Intraindustry trade indices

#5. Parts and components flow “wrong way”?

What explains this?

1. Old Globalisation (1st unbundling): Lower barriers allow nations to exploit existing comparative advantage. (Trade-led globalisation)
2. New Globalisation (2nd unbundling): Better ICT allows North->South flows of firm-specific knowhow that changes existing comparative advantages. (Knowledge-led globalisation)

Weak direct evidence of knowledge flows

Net receipts for IP (billion US\$)

Net receipts for IP (billion US\$)

Actual question addressed in this paper:

Can we identify GVC “paradigms”?

- Like “Inward Oriented” vs “Export Oriented” development paradigms of yesteryear?
 - e.g. Thailand focused on autos; Philippines much broader; Costa Rica focused on services, etc.
- Can we classify the “GVC Industrialisation Journeys” into helpful categories?

Trade in parts vs final goods

The necessary suspense of disbelief:

- Assume exporting parts from South to North reflects North-tech + South-wages (the tech is in the parts)
- Export of final goods less so (assembly activity is simpler and ubiquitous before 2nd unbundling)

But may be interesting even without suspended disbelief

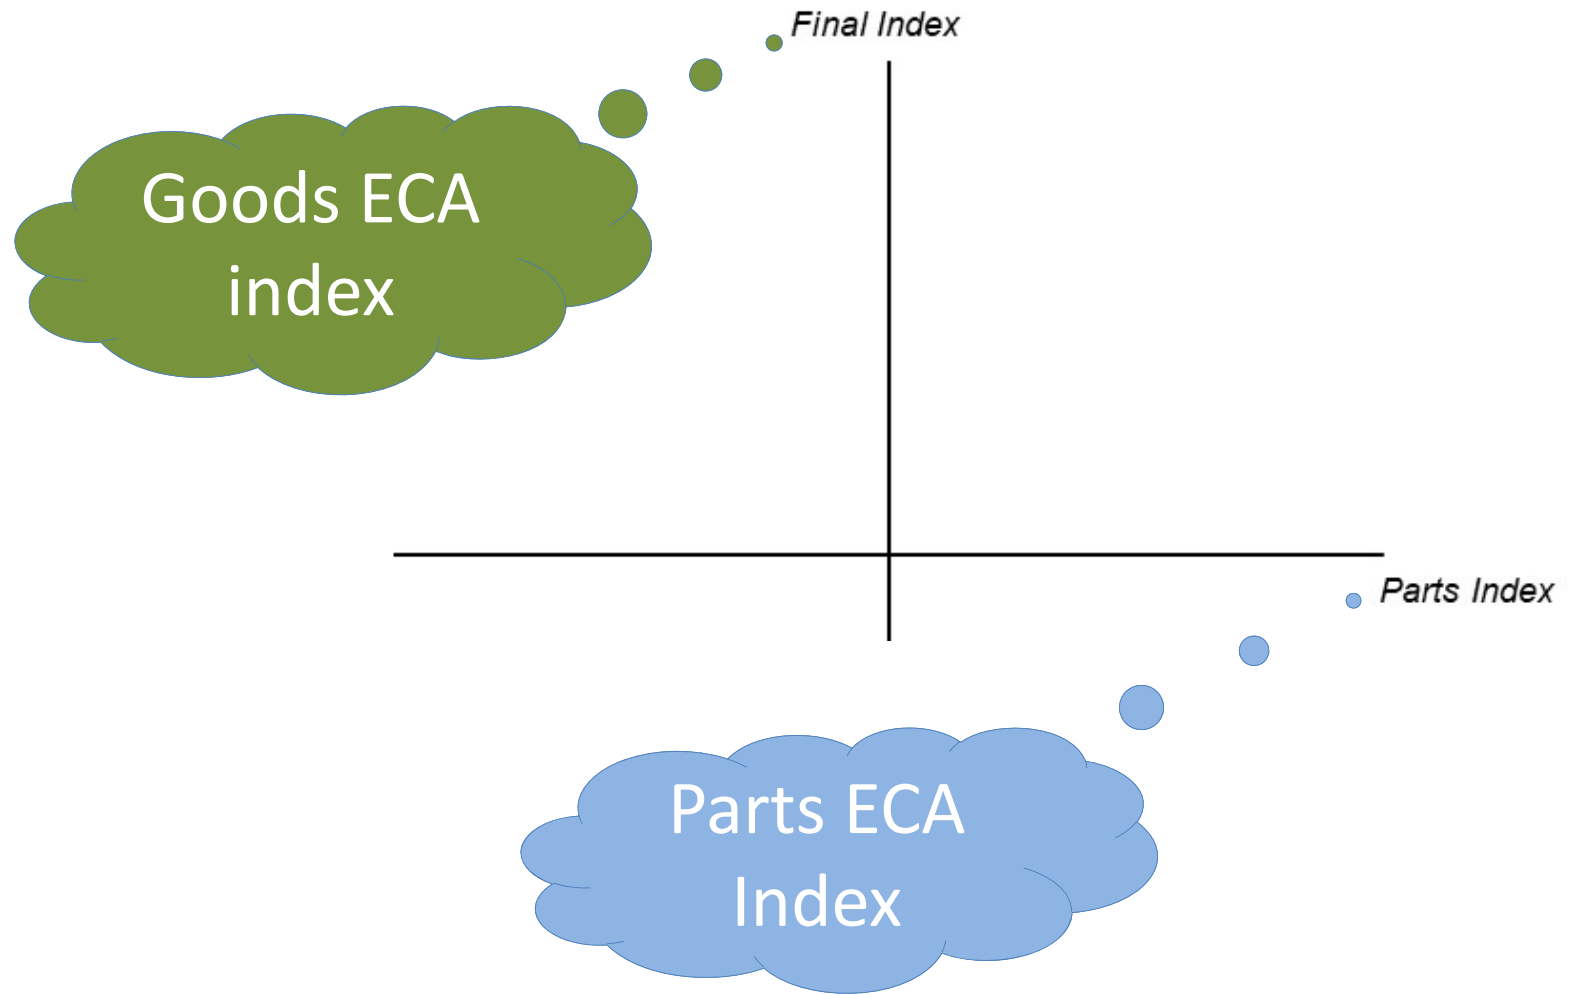

The GVC Journey diagram

- 1. Empirical Comparative Advantage (ECA) index

$$ECA_{cik} = \frac{X_{cik} - M_{cik}}{X_{cik} + M_{cik}}$$

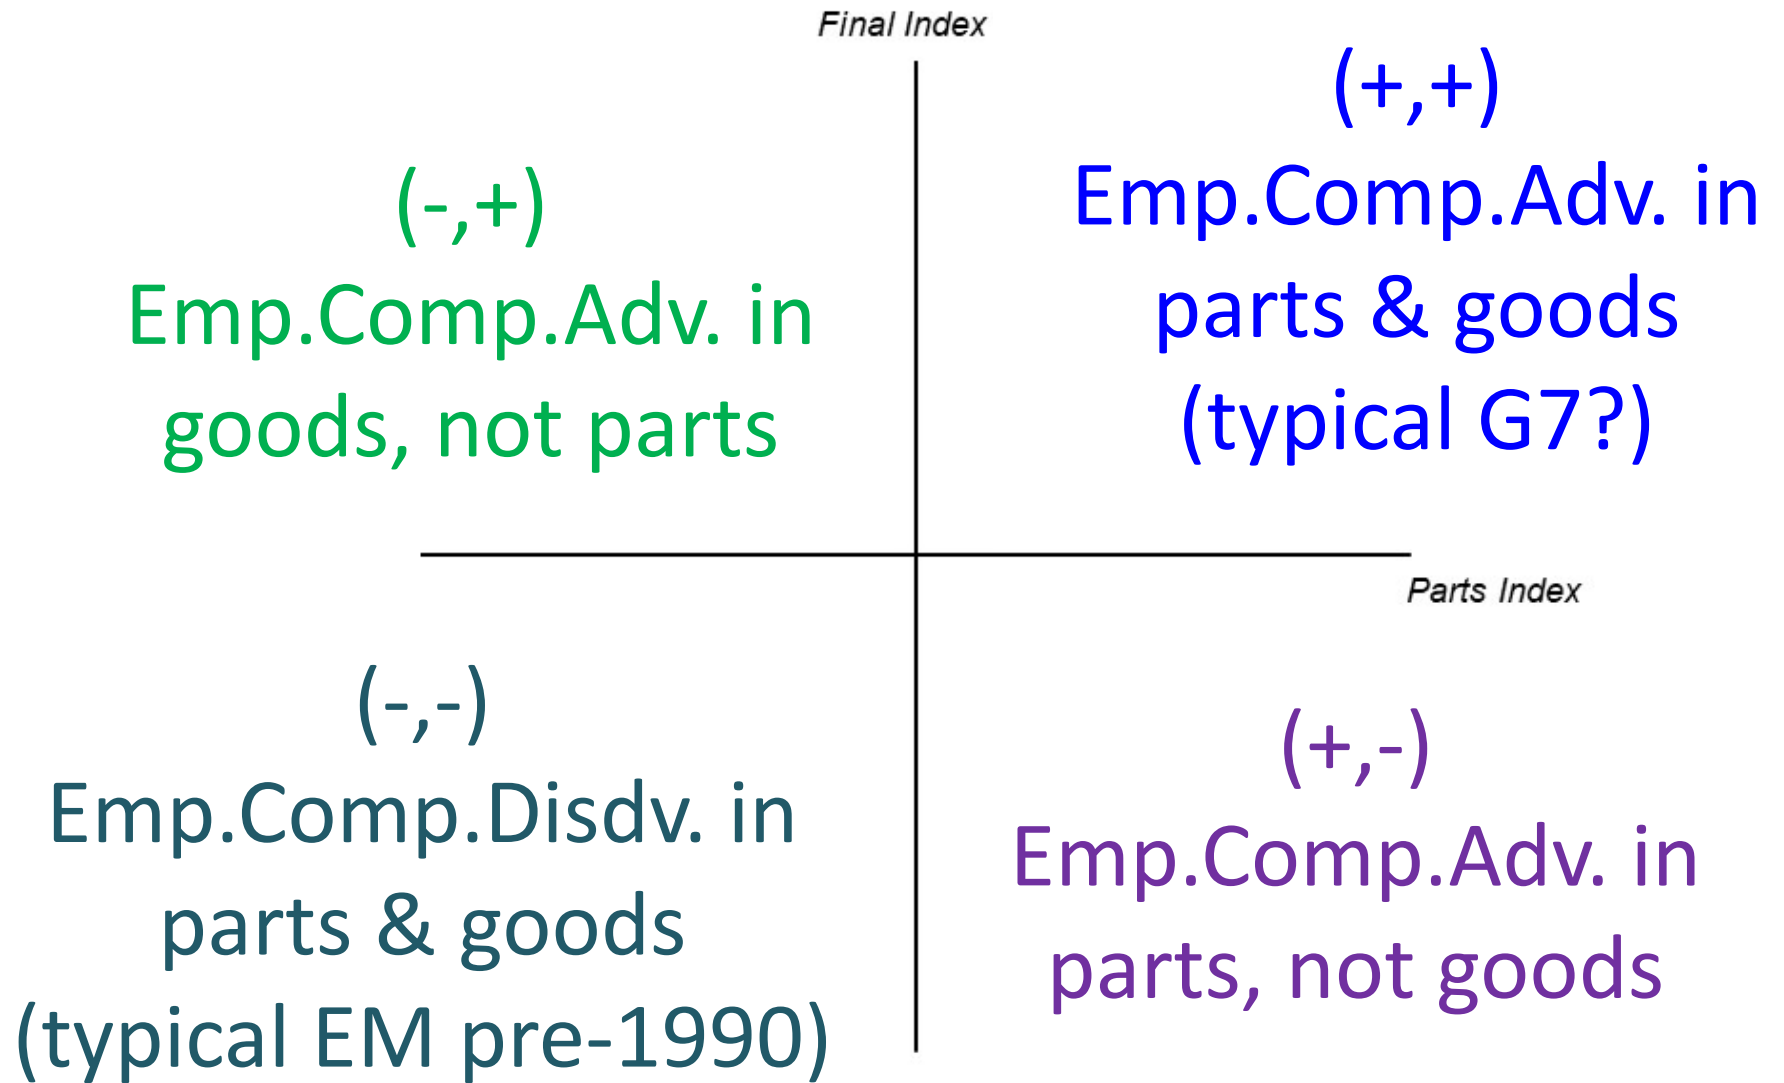

- For country 'c' in sector 'i' and k=parts, or goods
 - Measures "Territorial Comparative Advantage" (Comp.Adv. when sources of comp.adv. cross borders within int'l supply chains)
- From -1 (comp.disadv) to 1 (comp.adv.)

Spider: Basic assumptions

- Perfect competition, constant return, 2 regions.
- All final consumption in North.
 - Shipping costs of final good $\propto t$
= *traditional trade costs*
- Coordination cost:
 - Per-unit costs is $t\theta(y)$ paid if part not produced in region of assembly.
= efficiency loss due to spatial separation.

Comparative advantage

PARTS: Parts are indexed by type $y \in Y$

- Unit production cost are:
 - $b(y)$ in S
 - normalised to 1 in N.
- S has comp.adv. in parts $b(y) < 1$

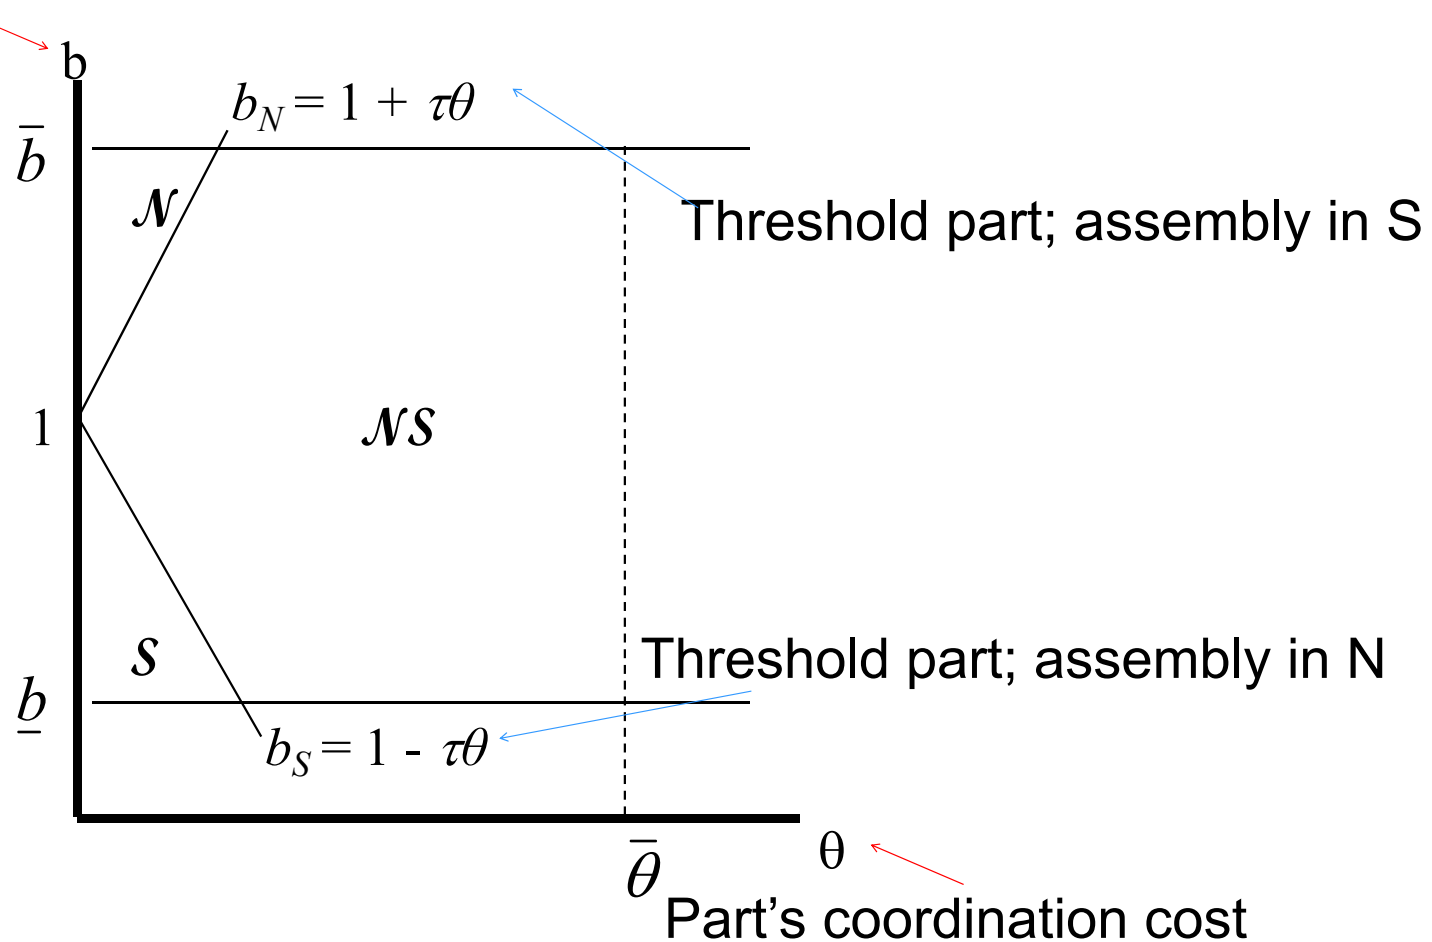

ASSEMBLY: Assembly of parts costs:

- a_N in N
- a_S in S.
 - S has comp.adv. in assemble iff $a_S < a_N$.

Intermed results: Spider

Each part is a point in b, θ space.

Part's relative cost in S

Spider

Part's relative cost in S

3 sets of parts, N, NS, S

- N: always cheapest in N
- S: always cheapest in S.
- NS: cheapest to co-locate with assembly.

Part's Offshoring cost

Cost minimisation

- Given sets N , S and NS chosen to min costs for given t
- Assembly in S iff

$$a_N + \int_{y \in N \cup NS} \psi(y) dy + \int_{y \in S} [b(y) + t\theta(y)] \psi(y) dy$$

- is greater than

$$a_S + \alpha t + \int_{y \in N} [1 + t\theta(y)] \psi(y) dy + \int_{y \in S \cup NS} b(y) \psi(y) dy$$

Offshore 'overshooting' & 'reshoring'

- Easy results:
 - Shift in assembly leads to 'too much' parts overshooting (compared to costless trade case) likely to occur.
 - Lowering 't' reverses this 'reshoring'.

Simple example

- Focus on comparative advantage;
 - Assume all coordination costs, θ 's, equal for all parts, so horizontal axis now " t ", not theta
- Start with assembly in North; assume $a_S < a_N$.

Result: Offshoring “overshooting” of parts

Production technology and distribution of comparative advantage

Asymmetric parts production and exports with knowledge-led globalisation
